

Nearest same-superpopulation neighbor in displayed MDS space

Each point contributes one Euclidean D1-D2 distance to its nearest same-superpopulation neighbor. KW global $p=3.5e-26$; brackets show BH-corrected

Metric: nearest other point from the same continental superpopulation in displayed D1-D2 MDS space; self excluded.

Boxes show group distributions; printed values are means. Y-axis is displayed from 0 to 1e-3 for readability; long-tail values remain in the tests and source table.

KW = Kruskal-Wallis global non-parametric test across groups. Pairwise Wilcoxon = rank-sum group comparisons.

BH = Benjamini-Hochberg FDR correction over pairwise tests. Brackets show five strongest BH-significant contrasts; full table is in nearest_same_superpop_pairwise_wilcoxon.tsv.
