

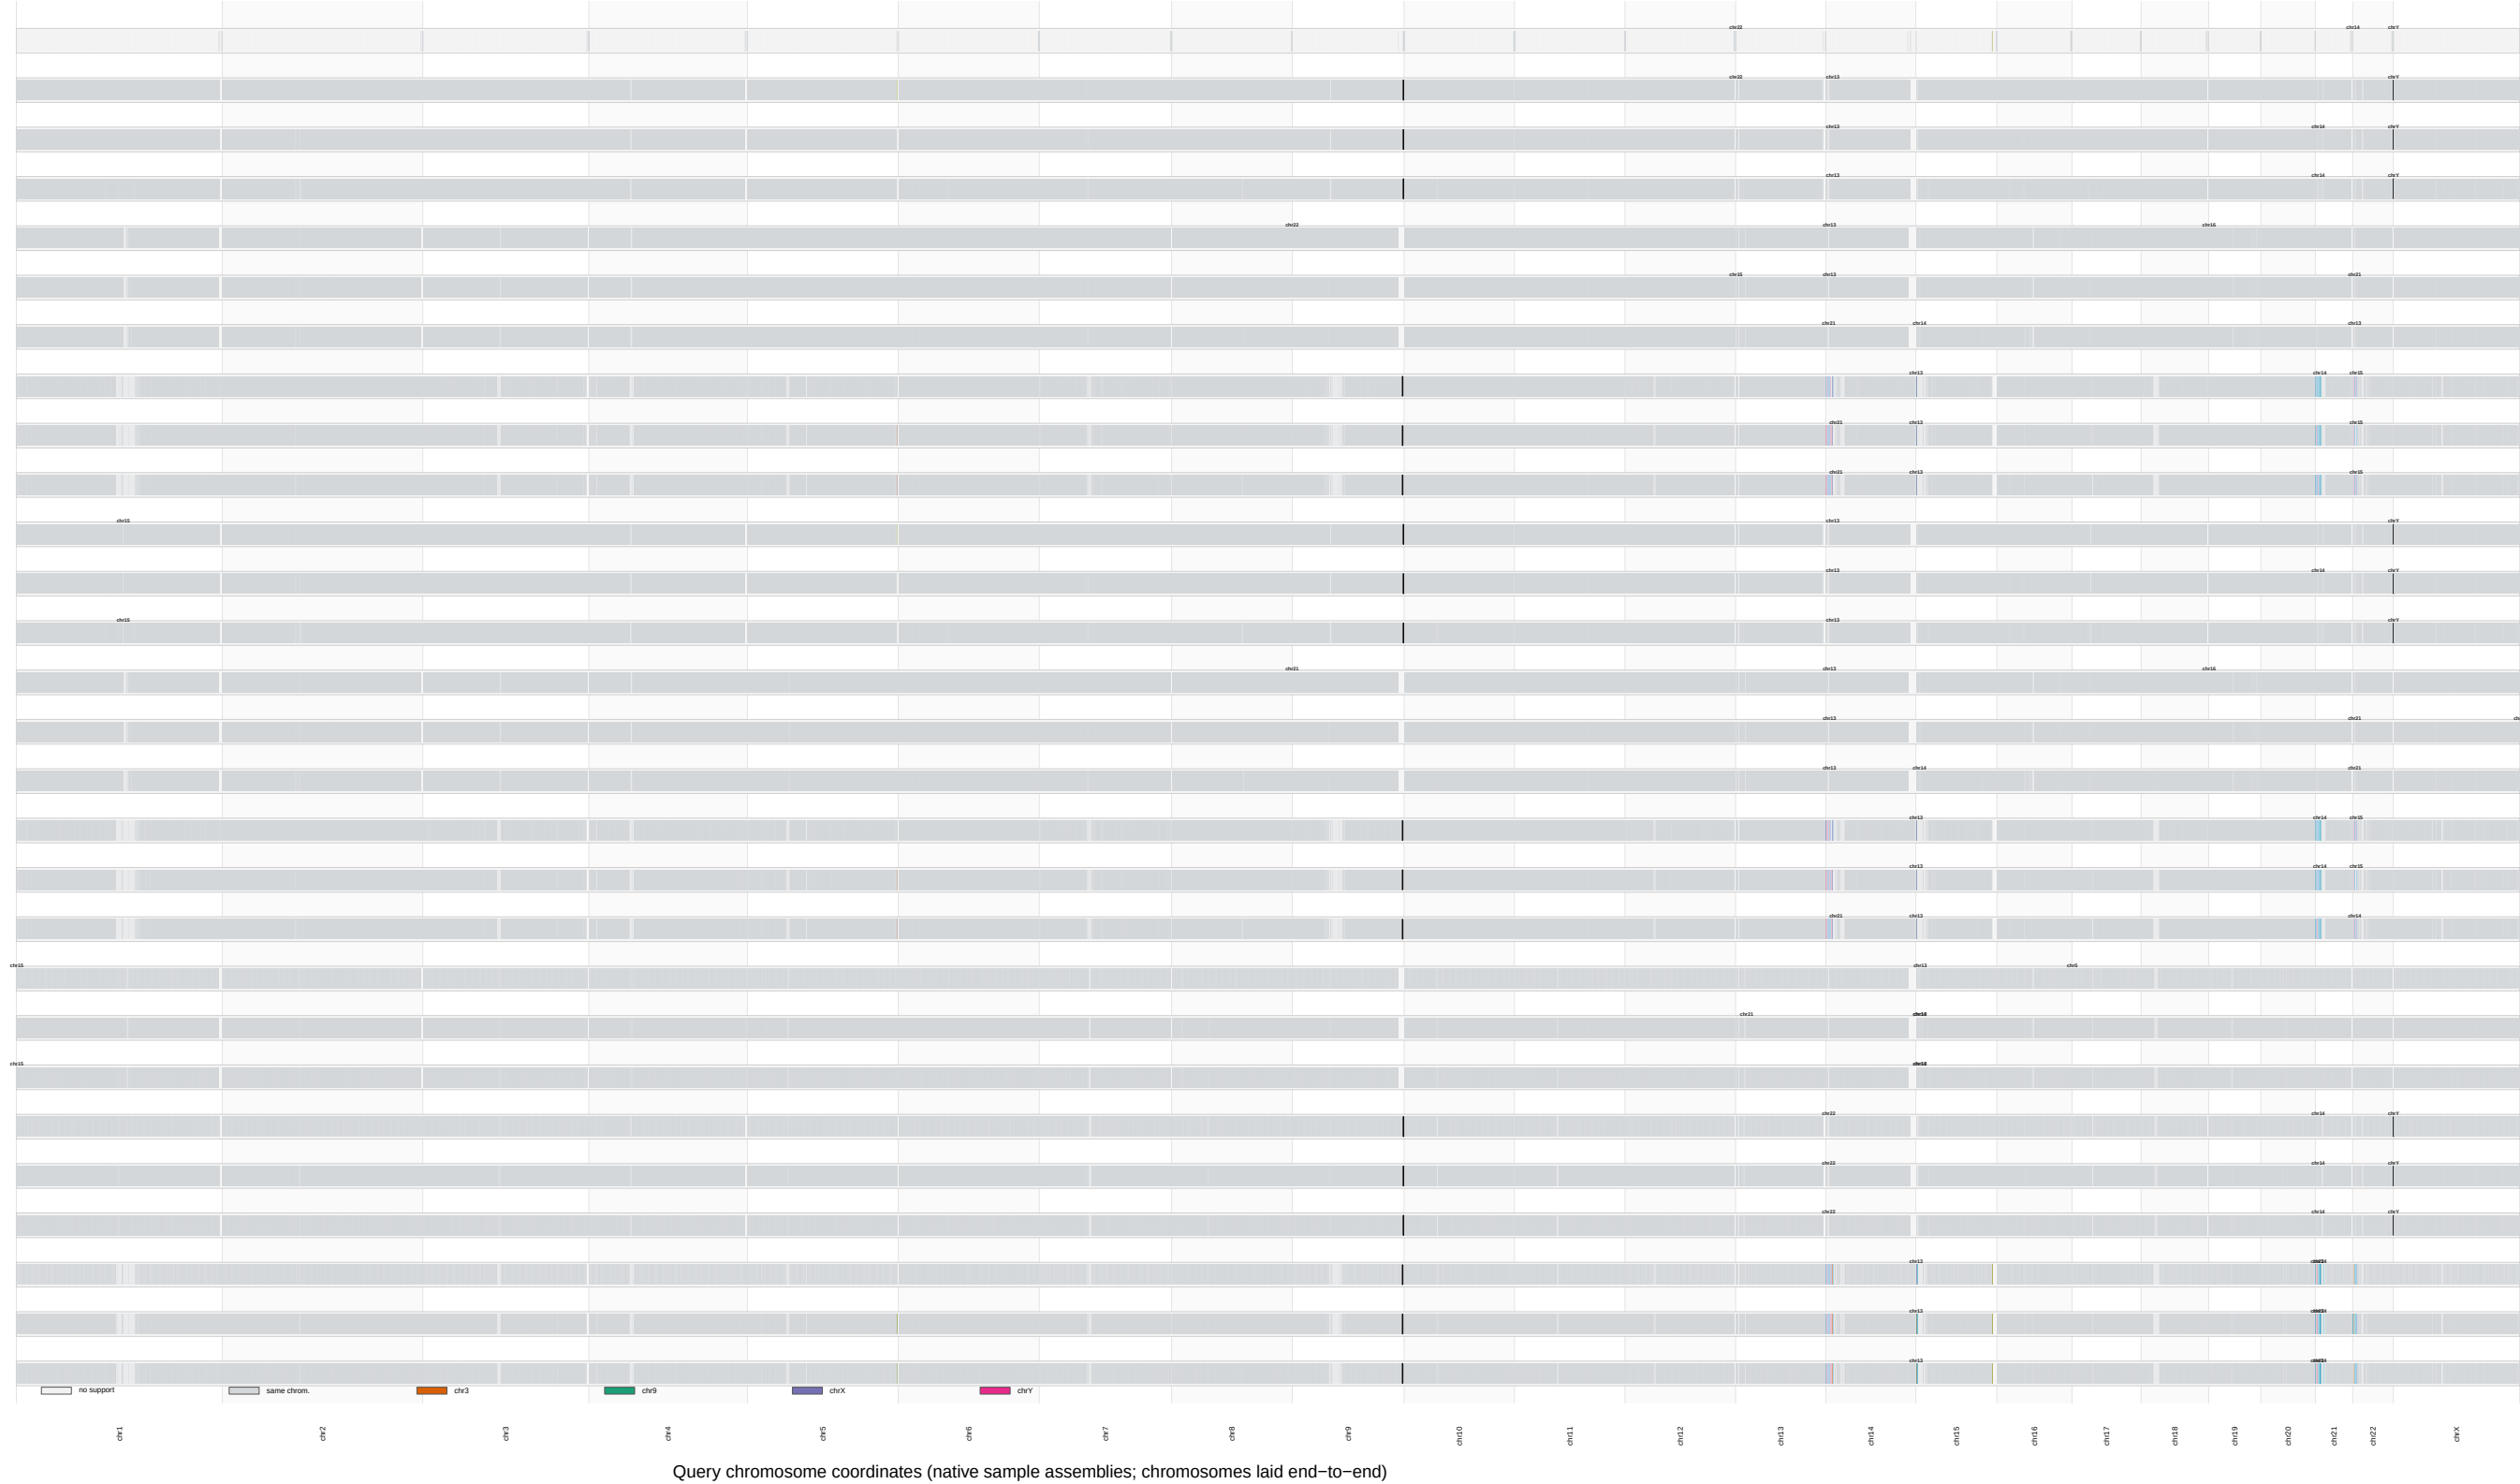

Fig5 whole-genome retained-target overview after strict / 1:1 ANI filtering

1 Mb query-coordinate bins. Neutral = no retained support; gray = same query/target chromosome; colored bins are dominant retained target chromosomes with direct labels for recurrent interchromosomal support.

Query chromosome coordinates (native sample assemblies; chromosomes laid end-to-end)

Compact interchromosomal support matrix by method/chop

Target chromosome labels printed in cells; full query-arm x target-arm table is in whole_genome_support_matrix.tsv

Secondary callouts: PAR1 and chr9q/chr3q candidate windows

Callouts reuse current query-grid genomic coordinates and remain subordinate to the whole-genome tracks.
