

Fig5 strict untangle primary–path geometry across terminal windows

One block per queried native terminal window/arm; coordinates are native assembly windows, not CHM13 projections

Genome–ordered queried arms; each arm block is scaled to its native terminal source window

Query–arm vs target–arm support

$\log_{10}(\text{interchromosomal strict bp} + 1)$

Largest switch burdens by query arm

Candidate windows: PAR1, PAN027 chr9q→chr3q, PAN028 chr9q→chr3q. Dashed/triangular marks retain side fragments as caveats.
