

Whole-genome homologous inheritance context with non-homologous winners

Light-gray ribbons are display-merged same-chromosome father-child homologous blocks; colored ribbons are interchromosomal winners from the same 10:10 IMPG scan.

Light gray: 94 same-haplotype homologous display blocks ≥ 10 kb; block merge allows ≤ 5 Mb query gaps.

All tracks use native whole-genome coordinates collapsed into length-scaled chromosome-order tracks.
