

PHR length distributions are right-censored at the 500 kb search cap

Violin = observed intervals grouped by named clade/background; box = median/IQR; triangles mark groups with rows reported at the cap. The search stops at 500 kb, so above-cap lengths are unobserved.

Source: all-vs-all.1Mb.p95.id95.len.tsv; unit = one non-empty inter-chromosomal PHR interval from region_end - region_start. No-signal arms in this TSV: 2p, 3p, 5p, 8q, 11q, 14q, 18q (n=0; excluded from violins)
