

Whole-genome homologous inheritance context with non-homologous winners

Light-gray ribbons are full same-chromosome father-child homologous chains; colored ribbons are interchromosomal winners from the same 10:10 IMPG scan.

Light gray: 364 full same-chromosome chains ≥ 50 kb at identity ≥ 0.95 ; gray width scales with grouped chain length.

All tracks use native whole-genome coordinates collapsed into length-scaled chromosome-order tracks.
